Presenter notes

Five minutes. Each block matches one slide, in order.

1 IntelliClass

On the slide

One place for homework, quizzes and progress. Accountability, less admin, a clearer parent view.

Say

About 20 seconds.

IntelliClass is a web platform for schools.

It keeps homework, quizzes, study material and performance in one place.

AI assists. Teachers still decide what learners see.

2 The problem

On the slide

Missed work, slow preparation, late news for parents, no single record — and why each one matters.

Say

About 40 seconds.

Homework is easy to miss.

Teachers still spend a long time preparing assessments by hand.

Parents often only hear how a child is doing at report time.

There is no single record they can all use.

3 The proposed solution

On the slide

What each role actually does, including teacher review of AI drafts.

Say

About 30 seconds.

The proposal is one platform and four roles.

The next slide shows the exact work each person can do.

The aim is more accountability, less admin, and earlier support.

4 Who does what

On the slide

Use cases: setup, upload, AI draft, review and publish, quiz, explanation, parent progress.

Say

About 35 seconds. Point at the people. Do not read every oval.

The administrator sets up users, classes and subjects.

The teacher uploads the notes, asks for a draft, then reviews and publishes.

The learner takes only a published quiz, and can ask why an answer was wrong.

The parent views progress.

The tinted cases call Hugging Face.

A quiz stays hidden until the teacher publishes it.

5 Architecture

On the slide

React dashboards, Node sign-in and AI call, PostgreSQL records, Hugging Face.

Say

About 40 seconds.

React is what people see.

Node and Express hold the rules and call the AI.

PostgreSQL stores users, materials, homework, quizzes and results.

The model is an external pre-trained service, so the key stays on the server.

A browser is enough. Each role only opens its own functions.

6 Emerging technology

On the slide

Draft from the PDF, summarise stored scores, explain a wrong answer. Not published yet.

Say

About 40 seconds.

AI is used in three places only.

It drafts quiz questions from the teacher’s own study material.

It summarises stored results and points to topics that may need attention.

When a learner misses a question, it explains why and suggests what to revise.

Nothing is published until a teacher approves it. AI does not decide a pass or fail.

7 Prototype

On the slide

Role sign-in, chapter PDFs, difficulty and publish, stored score, explanation, parent note.

Say

About 40 seconds.

A person signs in to their own dashboard.

A teacher uploads a PDF. The text is extracted, including by chapter.

They can ask for a draft, choose a difficulty mix, edit it, and only then publish.

A learner takes the quiz, the score is stored, and a wrong answer can ask for an explanation.

Parents can see results, and a teacher can write to them.

Homework tracking and term reports are also in the system.

8 Results and limitations

On the slide

Review before publish, notes check, stored scores. Vague output, scanned PDFs, fallback, no pass mark.

Say

About 40 seconds.

The path from a PDF to a stored score works.

Questions are checked against the notes, and the teacher can edit or reject a draft.

The model can still be vague or wrong.

A scanned PDF cannot be read.

If the AI service fails, a simpler draft is built straight from the notes.

It is a website, not a phone app.

9 Questions

On the slide

Clearer work. Lighter admin. Earlier support.

Say

About 15 seconds.

Close on those three lines.

Then take questions.

If a question is about AI, go back to the three uses or the quiz path.
